

Displacement & Education

How Refugee Crises Affect School and Internet Access in
Afghanistan, Bangladesh, and Myanmar (2010-2024)

Zulaikha Mohammadi

Practical Data Science: Tools for Social Change

Date: 20 May, 2026

WHY THIS MATTERS ?

When People flee war, their education often Stop!

The Numbers:

-  3.75 MILLION Afghans fled their country (2023)
-  486,000 Myanmar refugees (2023)
-  1+ million Rohingya hosted by Bangladesh
- Bangladesh: stable, few refugee (our comparison)

Who is affected?

- Refugee children (lost years of schooling)
- Host communities struggle to educate everyone
- Future of entire generations at risk

Why Now?

- More people displaced than ever before
- Education = path out of poverty

What the Data Reveals

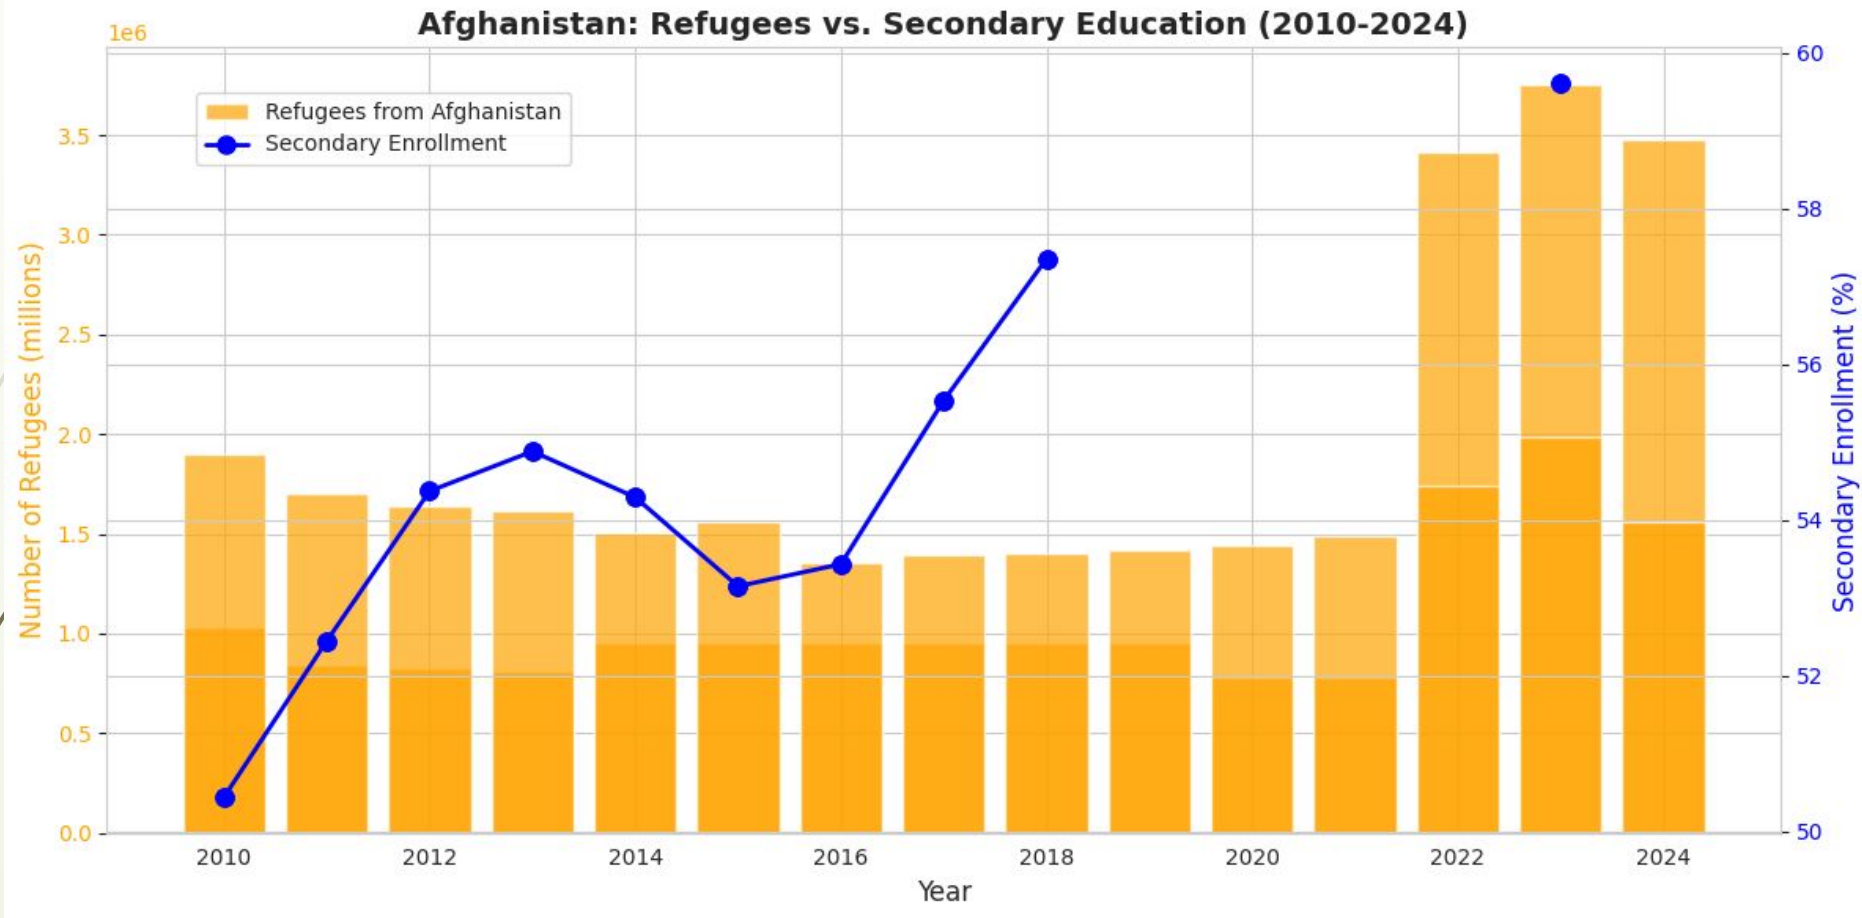

COMPARISON: THREE COUNTRIES (2023)

Country	Displacement	Internet (2023)	Secondary School
Afghanistan	High - 3.7M fled	15.9%	59.6%
Bangladesh	Low - stable	44.5%	66.0%
Myanmar	Crisis (2017)	No Data	No Data

What This Tell Us:

Countries with high displacement have LOWER internet and school enrollment compared to stable countries.

What the Data Reveals

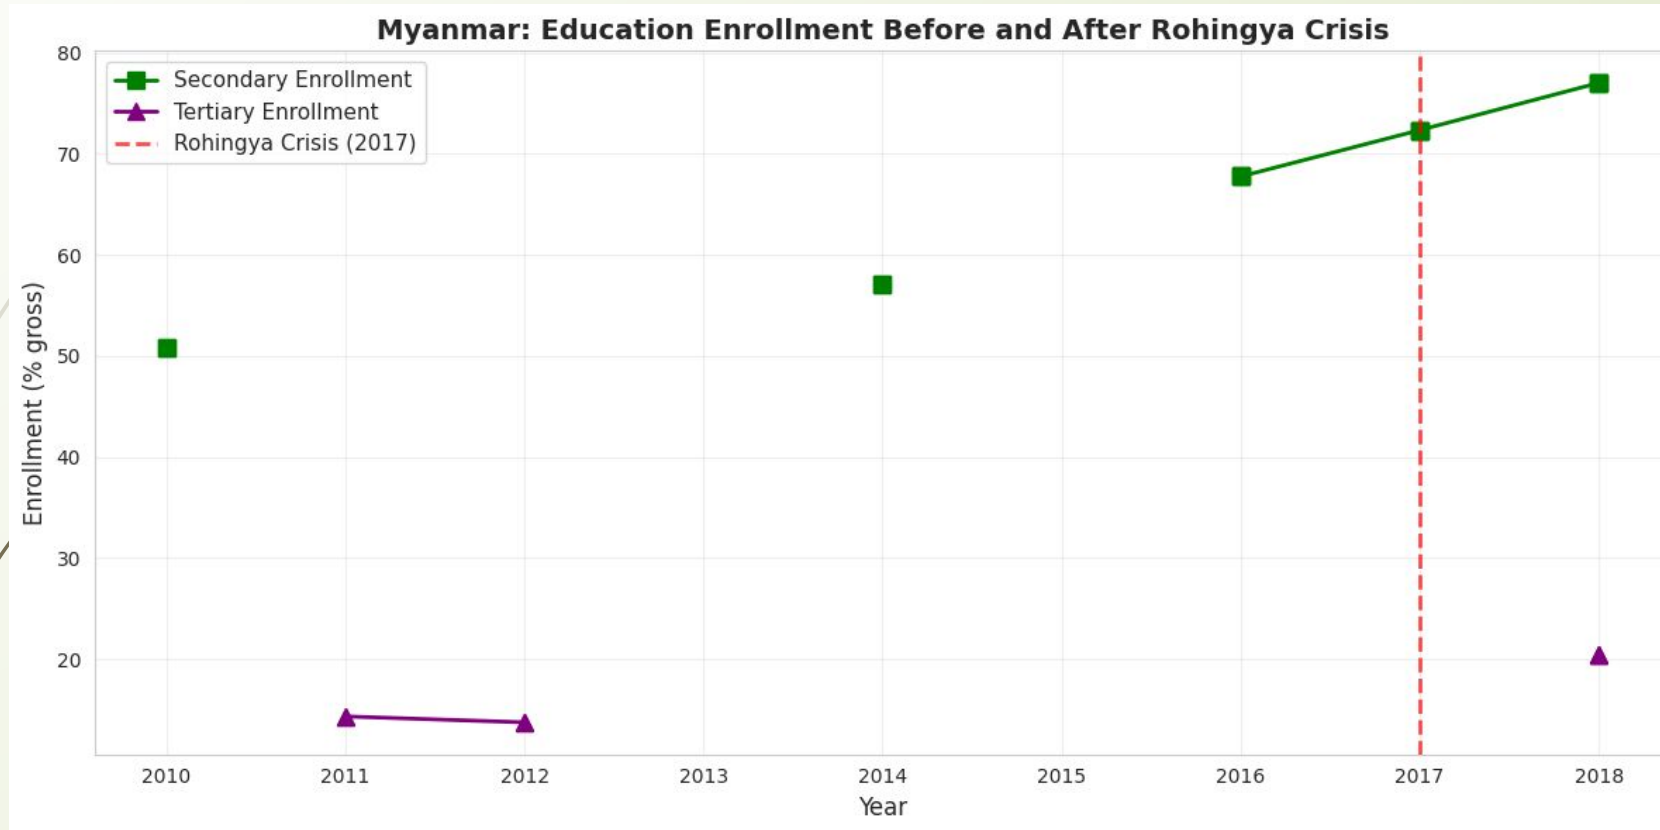

Key Discovery:

- Orange bars (refugees): 1.4M → 3.7M (UP)
- Blue line (education): 50-60% (FLAT)

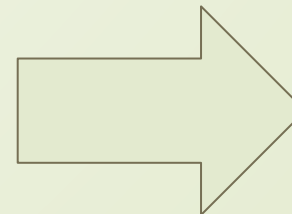

As MORE people fled Afghanistan,
education did NOT improve.

What the Data Reveals

Key Discovery:

- **RED LINE = Rohingya crisis (2017)**
- **BEFORE 2017: Stable education enrollment**
- **AFTER 2017: Education data DISAPPEARS**

**The missing data itself tells us:
the education
system collapsed**

How I Did this?

Data Sources:

- World Bank → internet users, school enrollment
- UNHCR → refugee numbers by country

Tools:

- Python with pandas → cleaned and merged 4 datasets
- Matplotlib & seaborn → created the graphs
- Google Colab → wrote and ran my code
- GitHub → saved my work (multiple commits)

Key Steps:

1. Downloaded data for 2010-2024
2. Filtered to Afghanistan, Bangladesh, Myanmar
3. Merged all datasets by Country + Year
4. Created 4 visualizations to tell the story

Biggest Challenge:

Myanmar had no education data after 2017. I kept it and explained it - the missing data itself tells a story.

So What? What Should Change?

FOR NGOs (UNHCR, Save the Children, IRC):

Put 15% of refugee funding (\$450 million each year) into secondary schools in countries hosting refugees.

FOR POLICYMAKERS (Governments, UN):

Require host countries to report school enrollment for refugee children before giving them aid money.

FOR TECH COMPANIES (Google, Microsoft):

Deploy offline learning apps in refugee camps within 6 months. Start with Cox's Bazar in Bangladesh.

ONE SENTENCE: Because displacement disrupts education, we need to give refugees more school support and internet access.

WHAT CHANGES? WHAT'S NEXT?

IMPACT IF WE DO THIS:

- Refugee children can keep learning even while displaced
- Host countries get resources to support everyone
- We can track progress with real data

LIMITATIONS (I was honest about these):

- ⚠ Correlation $\neq$ causation - war causes BOTH problems
- ⚠ Missing data from Myanmar after 2017
- ⚠ No breakdown by gender - don't know if girls did worse
- ⚠ Only 3 countries - need more to be sure

NEXT STEPS:

1. Add data by gender (from UNESCO)
2. Interview teachers in refugee camps
3. Build a model to predict which countries are at risk
4. Add 7 more countries to make findings stronger

“Because displacement
disrupts education, we need to
give refugees more school
support and internet access.”

Thank you!
